

$$\partial_t V_g =$$

The image displays two Feynman diagrams representing the time derivative of the gluon potential, $\partial_t V_g$.

The first diagram (left) shows a gluon loop (represented by a circle with wavy lines and arrows) with two external gluon lines (wavy lines) attached to the loop. The external lines are labeled with momentum p . The loop is connected to the external lines via vertices (black dots). The loop itself has a four-gluon vertex (represented by a circle with an 'X' inside) at the bottom.

The second diagram (right) shows a gluon loop (represented by a circle with wavy lines and arrows) with two external gluon lines (wavy lines) attached to the loop. The external lines are labeled with momentum p . The loop is connected to the external lines via vertices (black dots). The loop itself has a ghost loop (represented by a circle with an 'X' inside) at the bottom.
