

$$\partial_t V_g =$$

The equation shows the time derivative of the gluon potential, $\partial_t V_g$, expressed as the sum of two Feynman diagrams. Both diagrams consist of a circular loop of gluons, represented by wavy lines with arrows indicating a clockwise flow. The momentum of the gluons in the loop is labeled p at four points. Each diagram contains a shaded circular vertex with a cross inside, representing a ghost loop insertion.

The first diagram on the left shows the loop with two external wavy lines extending horizontally from the left and right vertices. The second diagram on the right shows the loop with two external wavy lines extending diagonally upwards from the left vertex.
